1. INTRODUCTION

A network of automatic weather station (AWS) units is deployed to collect Antarctic surface weather observations in support of specific meteorological research projects as well as operational activities in Antarctica. The 2000 network consisted of 52 installed AWS units providing observations on the Ross Ice Shelf, east of the Transantarctic Mountains and north of McMurdo to the Adelie Coast, along the Antarctic Peninsula, West Antarctica, and climatological locations such as the South Pole. Each unit measures air temperature, wind speed, and wind direction at the top of the unit's tower at a nominal height of three meters and air pressure at the electronics enclosure (Figure 1). Some AWS units also measure the relative humidity at three meters and vertical air temperature difference between 0.5 and 3 meters. Measurement heights relative to the actual surface at the site are nominal due to snow accumulation around the AWS unit.

2. DATA TRANSMISSION

The transmitted AWS data are received and stored by the ARGOS data collection system on the NOAA series of polar orbiting satellites. The data are retransmitted by the satellite for use in the High Resolution Picture Transmission (HRPT) broadcast at McMurdo, Antarctica. The data are processed into scientific units and are available for local use. The complete data set is received at the University of Wisconsin-Madison from Service ARGOS, Largo, Maryland, for processing and distribution to the users.

3. AWS IDENTIFICATION AND LOCATION

Site location is defined by the latitude and longitude which is determined by various methods: sun shots, angles to geographical features, aircraft data, ice breaker data, the platform location system of Service ARGOS, and the Global Positioning System. AWS elevation is obtained by barometry and Global Positioning System (GPS) and should be correct to within +/- 5 meters. Site names were introduced for convenience. Table 3.1 lists the site name, ARGOS identification number, latitude, longitude, elevation, start date for the site, and the World Meteorological Organization (WMO) number for the site. Figures 2, 3, and 4 show the locations of the AWS units in the Antarctic for 2000.

The ARGOS identification number (ID) is used to identify the data sets distributed to the users. AWS units are sometimes moved from one location to another, and as a result, the ID at a given site may change from year to year. The site name does not change. Table 3.2 lists the site name with the ARGOS ID, the site start date, and the ID start and stop dates.

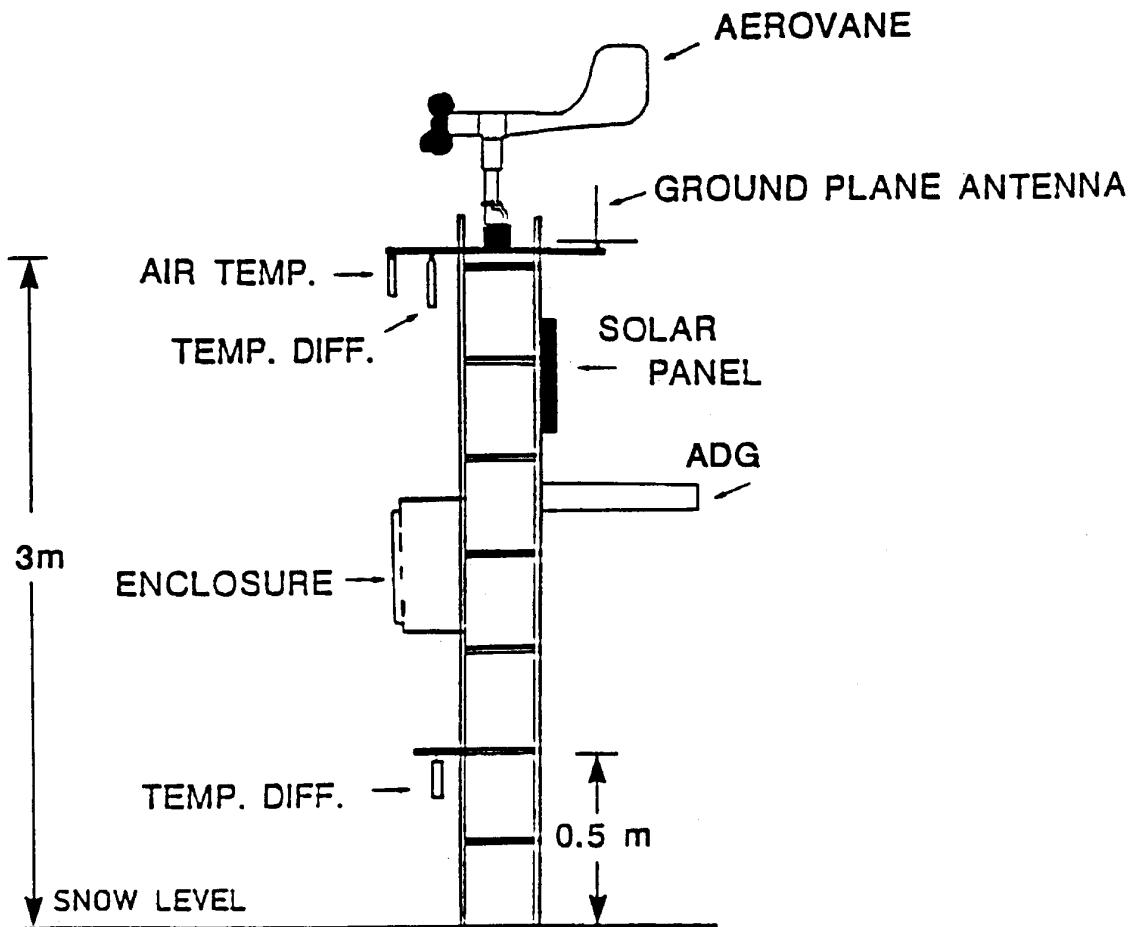

Figure 1. Layout of the AWS unit used in the Antarctic. The installed AWS unit has a 3-meter tower with a horizontal boom supporting the antenna, aerovane for measuring wind speed and direction, air temperature resistance thermometer, upper thermopile for measuring vertical air temperature difference, and the relative humidity sensor. The electronics enclosure is mounted at the midpoint of the tower. The gel cell batteries are placed at the tower base. The solar panel, located near the tower top, faces north. The Acoustic Depth Gauge (ADG) is installed on some of the AWS units to measure snow depth for precipitation studies.

4. AWS DATA SUMMARIES

The data received by the University of Wisconsin, Space Science and Engineering Center, contain all the information received by the ARGOS system including duplicate and erroneous transmissions. Invalid data are eliminated during a quality check, and the valid data are converted to scientific units producing the complete data set. Data selected at three hourly intervals, plus or minus forty minutes, produce a three hourly data set for each AWS unit month. Section 6.1, AWS Performance, provides some explanations for missing and invalid data.

Use of the 2000 Antarctic AWS data for publication should acknowledge the support of NSF-OPP Grant 9726040 or reference this publication.

4.1. Monthly Data Summaries

The monthly summaries consist of the monthly means, from the three hourly data set, and the extremes, from the complete data set. For monthly values to be included, 25% of the three hourly observations must be available. Months with 50-75% of data missing occur most often when a station is started or stopped in the middle of the month. This can cause a bias in the monthly mean, especially during seasons when parameters such as temperature change rapidly. Annual means are calculated only when twelve months of data are available. The data are presented in the same order as the sites listed in Table 3.1. Definitions of the monthly data summary headings are listed below.

Heading	Definition
Mean air temperature, °C.	Mean value for the month.
Percent of monthly data missing.	Ratio of the number of missing observations to the number of possible observations X 100.
Maximum air temperature, °C. Minimum air temperature, °C.	Maximum value for the month. Minimum value for the month.
Mean wind speed, m/s.	Mean value for the month.
Percent of monthly data missing.	Ratio of the number of missing observations to the number of possible observations X 100.
Resultant wind speed, dir/vv. Constancy.	Resultant speed and direction for the month. Ratio of the monthly resultant to the monthly mean wind speed.
Maximum wind speed, dir/vv.	Maximum wind speed and direction for the month.
Mean air pressure, mb.	Mean value for the month.
Percent of monthly data missing.	Ratio of the number of missing observations to the number of possible observations X 100.
Maximum air pressure, mb. Minimum air pressure, mb.	Maximum value for the month. Minimum value for the month.
Potential temperature, K	Mean value for the month.

4.2. Three Hourly Data Summaries

After the data are received from Service ARGOS, ten minute interval data are created for each AWS unit. The data are calibrated for the individual station instruments, but no other corrections are made. This data set is created for those users who need fairly current information. These data are available by anonymous FTP (see Section 8).

The 10 minute data set for each AWS unit for the month is scanned to pick out the nearest observation within forty minutes of the UTC hours 00, 03, 06, 09, 12, 15, 18, and 21 to produce the three hourly data set. If valid data are not available within forty minutes of the three hourly time interval, then the entry is left blank to indicate missing data. The means, standard deviations, resultant wind speed and direction, the distribution of temperature, and wind speed with wind direction are determined from the three hourly observations and are presented as a monthly summary at the bottom of each page. A wind direction value of zero indicates a wind speed less than 0.50 m s^{-1} . North is indicated by a value of 360 degrees. The maximum and minimum values are taken from the complete 10 minute data set, not the three hourly data set. The appropriate monthly data from the three hourly data set are used for the monthly summaries presented in Section 4.1. In the presence of sunlight the air temperatures are questionable if the wind speed is less than 1 m s^{-1} . These summaries are available by anonymous FTP (see Section 8). If you are unable to access the Internet, we will send the information either on diskettes or paper. Please contact us for further information (the address is at end of Section 8).

5. AWS CALIBRATION

5.1. Temperature

The external and internal temperatures are calibrated using a 1000 ohm 0.05% resistor in place of the platinum resistance thermometers with 1000 ohms resistance at 0°C . Because the other resistances in the temperature circuit are known only to 1%, the temperature calibration will vary from one electronic unit to another. The correction factor determined from the calibration resistor is programmed into the read-only-memories for each unit. After the correction factors have been programmed into the AWS, a calibration box with 0.1% resistors is used to check the temperature calibration.

5.2. Pressure

The atmospheric pressure transducer is a Parascientific model 215A DigiQuartz® pressure gauge. The transducer frequency changes from a nominal 40 kHz at zero pressure to a nominal 36 kHz at 1000 hPa. The pressure resolution is about 0.05 hPa.

Paulin aneroid barometers calibrated against a mercury barometer of 10 mm bore are used to check the pressure gauge calibration. Comparisons are made between AWS units, a Parascientific Model 760-16B accurate to $\pm 0.1 \text{ hPa}$, and with the mercury barometers at Scott Base, Antarctica. The calibrations should be within $\pm 0.2 \text{ hPa}$.

The reference vacuum on the older pressure transducers can degrade with time with a maximum observed 4 hPa shift to lower pressure after fifteen years. Recalibration of each pressure transducer would be desirable when each unit is serviced.

5.3. Wind direction and Speed

The Belfort model 123 aerovane measures wind direction and speed. The aerovane rotates a potentiometer wiper, and the fraction of full scale of the potentiometer is measured. The wind direction is checked by positioning the aerovane to the cardinal directions relative to the boom supporting the aerovane. North or the potentiometer zero is towards the antenna on the boom and has a maximum dead zone of 3° . During the field installation, the boom is usually aligned along the north-south line as determined from the sun's azimuth, longitude, and Greenwich Mean Time. In some cases the 180° end of the boom may point in a direction other than south. At Manuela site, the 180° end of the boom points up the glacier and a correction is added to the data during processing. At Byrd site the wind is usually out of the north so the

boom was rotated 120° and the correction added during the data processing. The wind speed is determined from the aerovane tachometer voltage output as 0.0472 volt per meter per second. The aerovane tachometers are spun at 1800 rpm with a load of 1071.5 ohms, and the output should be 9.20 +/-0.05 vdc.

Additional wind sensors were used with AWS units for 2000. These were the R.M. Young wind monitor model 05103 and the Hydro-Tech WS-3 anemometer with the WP-3 aerovane. The Hydro-Tech system was used for measuring wind speed in the Adelie Coast area. The Hydro-Tech WS-3 is a disk rotor, 3 in. high and 12 in. overall diameter, with radial cups, and the threshold sensitivity is 3 mph. The anemometer utilizes a commercial dc tachometer generator. Output is 0 to +5 vdc (and 0 to 1 ma) over the desired full scale wind speed of 85 m/s. Accuracy is +/- 2%.

The R.M. Young monitor 05103 also used a 10,000 ohm potentiometer with a 3° dead zone so that the wind direction was recorded identically with the Belfort/Bendix aerovanes. The wind speed was from the range of 0 to 1.0 volt full scale corresponding to 50 m/s. Thus the calibration for wind speed was a nominal .195 m/s/bit for the R.M. Young with +/- 1% up to 50 m/s.

5.4. Relative Humidity

The Vaisala HMP-35A/45A humidity sensor output voltage varies linearly with relative humidity (U). The sensor is calibrated by placing it over saturated salt solutions with known relative humidities at room temperature: sodium chloride (U=75%), and lithium chloride (U=12%) are used. In addition, a dry inert gas, forced past the sensor, gives a 0% U, and the sensor output can be zeroed. Then, the gain setting can be set directly using a salt solution with a high relative humidity, such as sodium chloride. The resolution of the humidity sensor is about 1% and the drift is 2 to 3% per year in the field. The relative humidity data are not included on the summary pages but are included in the 3 hourly data sets.

5.5. Vertical Air Temperature Difference

Two junction thermocouples are used to measure the air temperature difference between 3 m and 0.5 m on the tower. The output is about 78 microvolts for 1°C temperature difference between the junctions at 0.0°C, dropping to 60 microvolts at -80°C. Zero output is adjusted to 0.4 volts, so that 0 to 1 volt corresponds to a -6°C to +9°C range of air temperature differences between 3 m and 0.5 m. The resolution is 0.05°C. Calibration of the individual systems is done by applying known voltages to the amplifier input. The vertical temperature difference data are not included on the summary pages but are included in the 3 hourly data sets.

6. AWS OPERATIONS SUMMARY FOR 2000

6.1. AWS Performance

Forty-seven AWS units were installed at the start of 2000 and 51 were installed by the end of 2000. Based on the installation months the AWS units delivered 85% of the temperature data, 82% of the pressure data and 72% of the wind data during 2000. Complete data sets were received from 12 AWS units and 38 AWS units operated for the installed period. Eleven AWS units were not received for one month or more during the year or stopped during the year. Some of the stations were not received during the winter months due to low battery voltage.

The wind system has the poorest performance. If the wind speed is zero or the wind direction is constant for extended periods (days to months) then the data is considered invalid. The reason for this behavior is not known but is believed to be due to the build up of frost on the wind system. This usually occurs in the winter season and at several AWS sites. The wind speed is most frequently zero when the wind direction is constant.

Site	Performance
D-10	The aerovane was "frozen" occasionally in July and August. The station transmitted erratically from July through the beginning of November and stopped transmitting 10

	September. Transmission resumed 5 November. The relative humidity sensor and delta-T sensor were not functioning.
D-47	Temperature sensor not functioning. Station transmitted erratically from July through early November. Station resumed normal transmission 5 November. No relative humidity or delta-T sensors.
D-57	Station stopped transmitting 18 January. No delta-T or extra high wind speed sensor.
Dome C II Port Martin	OK. The aerovane stopped functioning 16 February. No delta-T or extra high wind speed sensor. Pressure corrected for high wind speed conditions.
Cape Denison	Station stopped transmitting 29 April and resumed 27 May. Several transmission gaps of a week or more from June through October. New solar panel, batteries, and Junction box installed 18 December. Pressure corrected for high wind speed conditions. No delta-T or extra high wind speed sensor.
Penguin Point	The aerovane was "frozen" occasionally in July. The station stopped transmitting for part of August. Pressure corrected for high wind speed conditions. No delta-T or extra high wind speed sensor.
Sutton	Wind speed and direction not functioning properly because the tower may be leaning or have fallen. Station stopped transmitting from 9 August to 21 October and also parts of November and December. A few transmissions were received in September. Station removed 18 December.
Byrd	Station stopped transmitting 6 September due to low battery voltage. The wind direction was incorrect and so was removed.
Mount Siple	Site has a "dog house" AWS without wind speed and direction. Pressure sensor not functioning correctly January, February, parts of November, and December.
Theresa	Delta-T sensor buried. Station stopped transmitting 4 June, transmitted in mid-July, and then not until October.
Doug	Aerovane frozen occasionally in September. Relative humidity sensor not functioning.
Elizabeth Brianna	Aerovane "frozen" most of July to mid October. New batteries were installed and the station began transmitting on 18 January. The relative humidity sensor was not functioning until April, and it continued with sporadic problems through August.
Harry	The delta-T sensor is not functioning. The aerovane was "frozen" occasionally from May through October.
Erin	Aerovane not functioning until it was repaired 19 January. The aerovane was "frozen" occasionally from July through November.
JC Siple Dome	Site removed 19 January. Aerovane "frozen" occasionally from May through November. Delta-T sensor not installed.
Swithinbank Noel/ITASE	Delta-T sensor not functioning. Station installed on 19 January. Relative humidity sensor malfunctioning occasionally throughout the year. The aerovane was "frozen" occasionally from April through July. Station stopped transmitting 19 July.
Marble Point Ferrell	OK. New station installed 1 February. Erratic transmissions occurred by mid-February and the station stopped transmitting 11 March.
Pegasus North	Station was replaced on 3 February. Delta-T not functioning. The aerovane was "frozen" occasionally in September. Station transmitted erratically in November.
Pegasus South	Relative humidity sensor not functioning. Wind speed not functioning until the station was repaired 3 February. Aerovane "frozen" periodically May through November. Delta-T erratic all year.
Minna Bluff	Delta-T sensor not functioning. Aerovane occasionally "frozen" January, March through July, and September. Station stopped transmitting 28 September.
Linda	Aerovane occasionally "frozen" April through November.

Willie Field	Delta-T sensor not functioning.
Windless Bight	OK.
Herbie Alley	Pressure functioned erratically April through December.
Cape Spencer	OK.
Cape Bird	Pressure not functioning correctly January, February, and September through November.
Laurie II	New site established 1 February. Delta-T sensor not functioning. Aerovane occasionally "frozen" in May. Station stopped transmitting 5 June and began again on 26 October. Erratic transmissions in November and December.
Whitlock	Station stopped transmitting 9 January. Delta-T sensor not functioning.
Possession Island	Site has a "dog house" AWS without wind speed and direction. Increased instances of missing transmissions after October.
Manuela	Aerovane broken.
Marilyn	Aerovane occasionally "frozen" May through August. Station stopped transmitting 6 August due to low battery voltage.
Schwerdtfeger	Relative humidity sensor functioned erratically from mid March through October and then began working again for November and December. Aerovane "frozen" part of August and September.
Gill	Relative humidity sensor not functioning. Aerovane "frozen" part of June and July, all of August through October, and part of November.
Lettau	Transmitting with gaps in January and February. Aerovane "frozen" parts of October through December. November and December had many gaps in the transmission.
Elaine	Relative humidity sensor worked sporadically January through May.
Larsen Ice Shelf	OK.
Butler Island	Aerovane not functioning from mid-June through December. Pressure continues to need correction due to the failure of the precision time-based correction to the system clock.
Uranus Glacier	Station removed 19 January for repair and replaced 24 January. Large gaps in transmission October through December.
Limbert	Station removed for testing and reinstalled 10 February. Delta-T sensor not functioning. Aerovane stopped functioning 5 July. Large gaps in transmission in August and September due to low battery voltage.
Racer Rock	OK.
Bonaparte Point	Relative humidity sensor not functioning. Aerovane not functioning.
Sky Blu	OK.
Santa Claus Island	Station stopped transmitting 18 August with a few transmissions in October. No transmissions for November and December. Delta-T sensor not functioning. Relative humidity sensor erratic February through July. Aerovane "frozen" part of July.
Clean Air	Occasional problems with relative humidity sensor. Pressure functioning erratically March through November.
Henry	Station stopped transmitting 16 September and resumed transmitting 11 October as the battery recharged in the austral spring.
Nico	Aerovane occasionally "frozen" in August.
Relay Station	OK.
Mizuho	New site established 7 October. No relative humidity or delta-T sensors.

6.2. AWS Antarctic Field Activities

McMurdo area

On 1 February, Ferrell site was visited by Jason Vandervest. A completely new station was installed (AWS 21355) with help from the Twin Otter crew. Later on 1 February, a new station site was established near Cape Crozier (AWS 21364). This site will be called Laurie II.

On 3 February, Pegasus North and Pegasus South (AWS 8937) sites were visited by Dr. John Cassano and

Jason Vandervest. AWS 8928 at Pegasus North was removed and a new station (AWS 21357) was installed. At Pegasus South the aerovane was replaced.

West Antarctica

Dr. John Cassano, Dr. Chris Shuman, and Jason Vandervest flew to Siple Dome on 15 January to conduct AWS field work in West Antarctica. GPS coordinates were recorded for Siple Dome (8938) site, and it was noted that the boom was not aligned with north. On 18 January, the team went to Brianna (21361) site. Two battery boxes and 1 battery cable were replaced, and GPS coordinates were recorded. The team moved on to Elizabeth (21361) site where two new battery boxes and cables were installed, and GPS coordinates were recorded. On 19 January, the team went to JC (21357) site. The site was anchored loosely, and the antenna was broken. They were unable to replace the antenna, so the entire site was removed. On to Erin (21363) site, the team recorded GPS coordinates. They installed 2 new battery boxes and cables, raised the lower delta T boom because the probe was covered with snow, and replaced the Bendix/Belfort aerovane. Finally, the team installed a new AWS (8936) at Noel/ITASE site. GPS coordinates were recorded.

Polar Plateau

Dr. John Cassano reinstalled the Clean Air AWS (8987) at the new site at South Pole station on 26 January.

Mizuho AWS unit (21359) was installed at Mizuho Station on 7 October by members of JARE.

Adelie Coast

Rob Flint met the USGS Polar Sea in Hobart for the trip along the Adelie Coast. On 18 December Rob Flint and Blake Moore went to Port Martin (8909). The solar panel had been smashed by an impact. Some of the connectors and the junction box were so corroded by salt that it was impossible to do any work. A return visit with better tools and equipment was made on 20 December. New batteries, solar panel and junction box were installed. Also on 18 December, Gerd Wendler and Drew Egressey went to Sutton (8939). The station was removed and returned to the ship.

On 19 December, Rob Flint and Rachel Smith went to Penguin Point. They replaced the batteries and tightened the guys. A visual inspection showed the station to be in good condition with no evidence of salt corrosion. On 20 December, Rob Flint and LCDR Jackson went to Cape Denison. The batteries were replaced, and no evidence of salt deposition was found on the station. Installation of Cape Webb was scrapped due to transportation problems.

Antarctic Peninsula

The British Antarctic Survey serviced several of the units on the Antarctic Peninsula. Limbert (8925) site had stopped transmitting. The batteries were charged, so the unit was moved to Rothera on 14 January for further testing. A fault was found on the CPU board, and the unit was replaced on 10 February. A new tower section was added, and the boom was replaced. Uranus Glacier (8920) was visited on 7 January. The tower was raised, three new guys and deadmen were placed, and two new batteries and the junction box were replaced. The unit was removed to Rothera on 19 January because the transmissions were garbled. The 50 MHz oscillator was retuned, and the unit replaced on 24 January.

AWS unit 8917 (Sky-Blu) was revisited on 8 and 9 February. The tower was raised by two sections. Larsen Ice (8926) site was also visited on 9 February. Two new batteries were added and the guys were tightened. On 11 February, Butler Island (8902) site was visited. The tower was raised and new battery boxes added. The wind propeller was loose, and there is evidence of salt corrosion at the site.

7. GLOBAL TELECOMMUNICATIONS SYSTEM

The data from 31 Antarctic AWS units were entered into the Global Telecommunications System (GTS) during 2000. The data are collected by Service ARGOS. As soon as the data are received, Service ARGOS processes them and sends them on to the National Weather Service which distributes the data to the GTS. The data headers are:

SMAA14 KARS YYGGgg
SIAA14 KARS YYGGgg
SNAA14 KARS YYGGgg

where S indicates surface, M is main observations (at 00, 06, 12, and 18 UT), I is intermediate observations (at 03, 09, 15, and 21 UT), and N is any other time. AA14 is for Antarctica, and KARS stands for the Largo receiving center (backup is LFPW for the center in Toulouse, France). YY indicates the day in the month, GG is the hour, and gg is the minutes. Table 3.1 contains the WMO identification number used by the GTS grouped according to their purpose and proximity where possible.

The University of Wisconsin-Madison is responsible for obtaining WMO numbers for AWS sites and for providing Service ARGOS with calibration information for processing the data. The main reason for getting the AWS data into the GTS is to make sure that the data are available in near real time for all organizations operating in Antarctica.

8. DATA AVAILABILITY

The data from our Automatic Weather Stations are available by anonymous FTP. The IP address and domain name are 128.104.109.33 (ice.ssec.wisc.edu). The login is "anonymous" (do not use the quotation marks), and the password is your email address. Once you have logged in, change to the pub/aws subdirectory. A listing of our station locations, names, and ARGOS ID numbers is located in the file "biglist" in this subdirectory. It is meant to serve as a guide to our stations as their ID numbers sometimes change. A complete guide for navigating the site may be found in the file "readme.faq".

Our three-hourly interval data for Antarctica in ASCII text format are contained in the year subdirectories of pub/aws/antrdr. The data have been corrected, i.e. an effort has been made to remove the bad data points. These data take longer to process, so the data for recent months are not available in this format. Within each of the year subdirectories of pub/aws/antrdr, there are text files named "3hrlist??" (where ?? indicates the last two digits of the year). These files list what station's data are contained in which files. The files "readme.updates?" in pub/aws/antrdr contain information on updates and/or corrections to the data, and the file "readme.3format" contains file name construction information and format of the three-hourly data. The file "readme.mailinglist" contains information on joining a mailing list which distributes information on data updates and changes. To subscribe, send email to aws@ssec.wisc.edu requesting to be added to our mailing list.

The directory pub/aws/summary/monthly contains ASCII printable text files of the paper data summary sheets. The format of the files can be found in the file "readme.sum" while updates and corrections to the data are located in "readme.sumupdates". The data are located in year subdirectories of pub/summary/monthly.

For those users who need more current information, we have created 10 minute interval data in ASCII text format for each station. These data are located in year subdirectories of pub/aws/10min/rdr. The data have been calibrated for the individual station instruments, but no other corrections have been made. The data are generally available up to and including the last full month of this year. The year subdirectories also contain a text file named "namelist??" (where ?? indicates the last two digits of the year in question). These files list what station's data are contained in which files.

Several important readme files are located in pub/aws/10min/rdr. The file "readme.format" contains information on filename construction of the data, as well as well as file content and is a must for those

unfamiliar with the data. The files "readme.updates?" contain important information on changes/additions to the data.

Our site is available 24 hours a day, 7 days a week. If you have questions or problems, send email to aws@ssec.wisc.edu. We can also be reached by phone at (608) 265-2209 or (608) 265-4816 or fax at (608) 262-5947.

9. ACKNOWLEDGMENTS

This work is supported by the National Science Foundation, Office of Polar Programs, Grant 9726040 under the management of Dr. Bernhard Lettau. Assistance from the following countries is gratefully acknowledged. Expeditions Polaires Francaises installs and maintains the AWS units from the Adelie Coast to Dome C II. The British Antarctic Survey maintains the AWS units on the east side of the Antarctic Peninsula and south of Adelaide Island. The Japanese Antarctic Research Expedition (JARE) installs and maintains the AWS units at Relay Station, Mizuho, and Dome Fuji.
