Methods

- Collect AWS observations from Antarctic-IDD
 - Do subjective quality control – remove obvious outliers
- Collect model time series from MM5 and WRF forecasts
 - Near-surface data
 - Model integration time step
 - Grid point nearest AWS location
- Temporally interpolate model output and observations to 10-minute intervals.
- Plot the temperature and wind speed time series.
 - Two models
 - Two forecast cycles per day
 - 5-day forecasts
 - 20 different forecasts for any given observation time
- Produce some simple statistics
 - Bias and RMSE as a function of forecast time

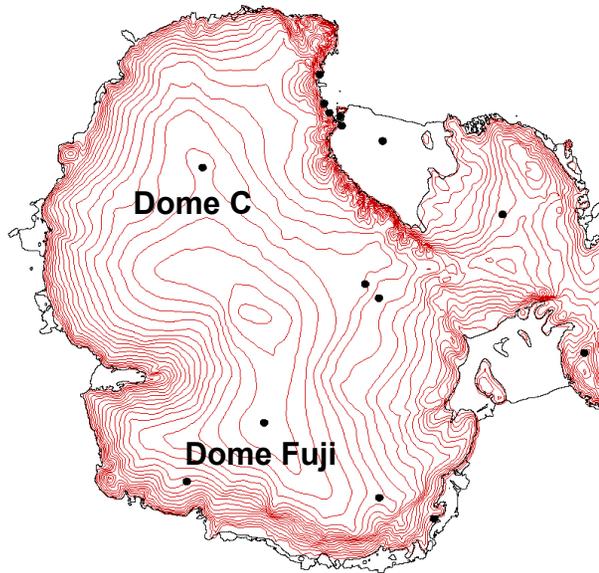

Caveats

- This study represents only the latest several weeks of data
 - Results and interpretation may turn out to be different for other seasons
- MM5 and WRF are on similar grids, with similar terrain fields, but the configuration is not exactly the same
- Differences in model output level:
 - MM5 output at lowest model level (~14 m AGL)
 - WRF output (diagnosed in PBL scheme) at 2 m (T) and 10 m (wind)
 - Think boundary-layer structure
- Surface data offer a very limited look at model behavior
 - Think boundary-layer structure again
- As always, the 0-36 hour of the 20-km grid, where nests are active, isn't straightforward to interpret, because of feedback from nests
- Fix from a few days ago casts doubt on the WRF results
 - Heat flux between atmosphere and sub-surface levels was essentially shut down

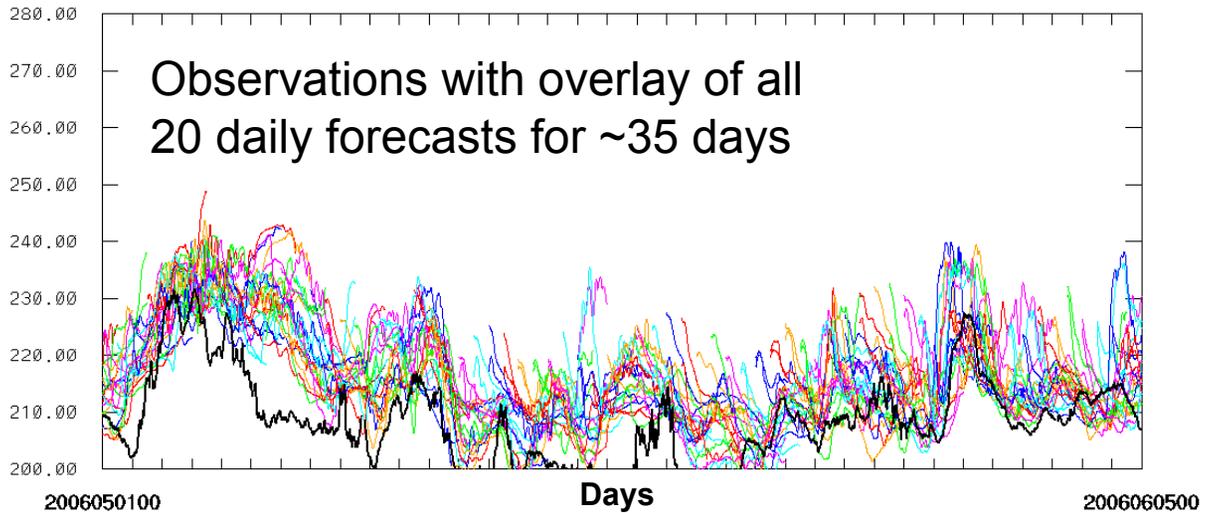

Conclusions

- MM5 and WRF are comparable
 - Similar behavior and similar failings
- Temperature:
 - Warm bias overall
 - WRF generally warmer than MM5
 - Can be a wide range of temperature values forecast for a given observation time
 - WRF seems to have more spread
- Wind speed:
 - Wind events seem to be handled pretty well in both models
 - WRF generally has lower speed bias
- We inherit some problems from the GFS initialization
 - Perhaps this contributes to our overall warm bias?
- If we can address the warm bias, we would have a significant improvement in surface temperature forecasts
 - Possibilities:
 - Initialization
 - Ice temperatures, and initialization thereof
 - Ice, surface-layer physics, radiation, heat fluxes
 - Boundary layer structure, development of stable layer

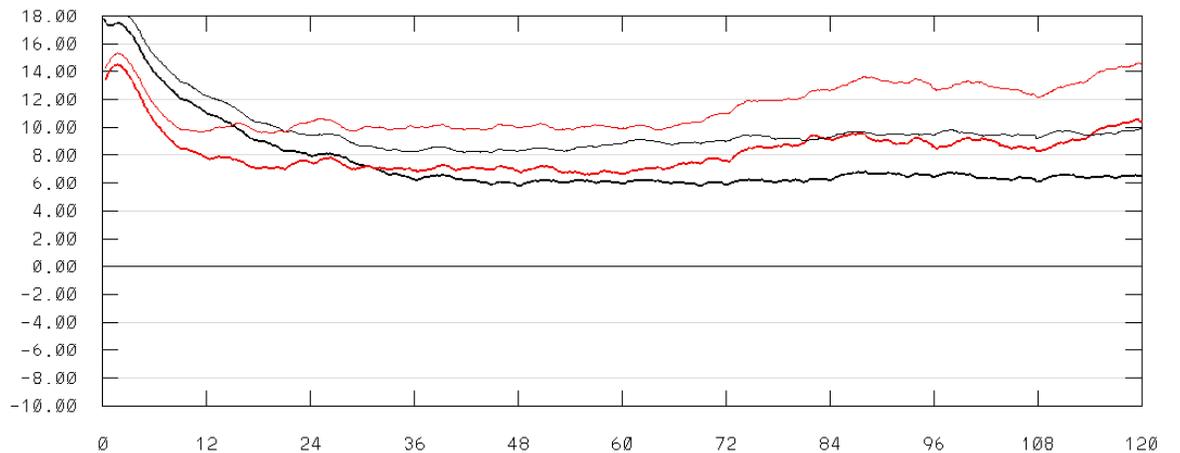

Let's get to the pictures

Dome C -- Temperature (K)

MM5 (black) and WRF (red) bias (fat) and RMSE (thin) as a function of forecast hour (note change in horizontal axis)

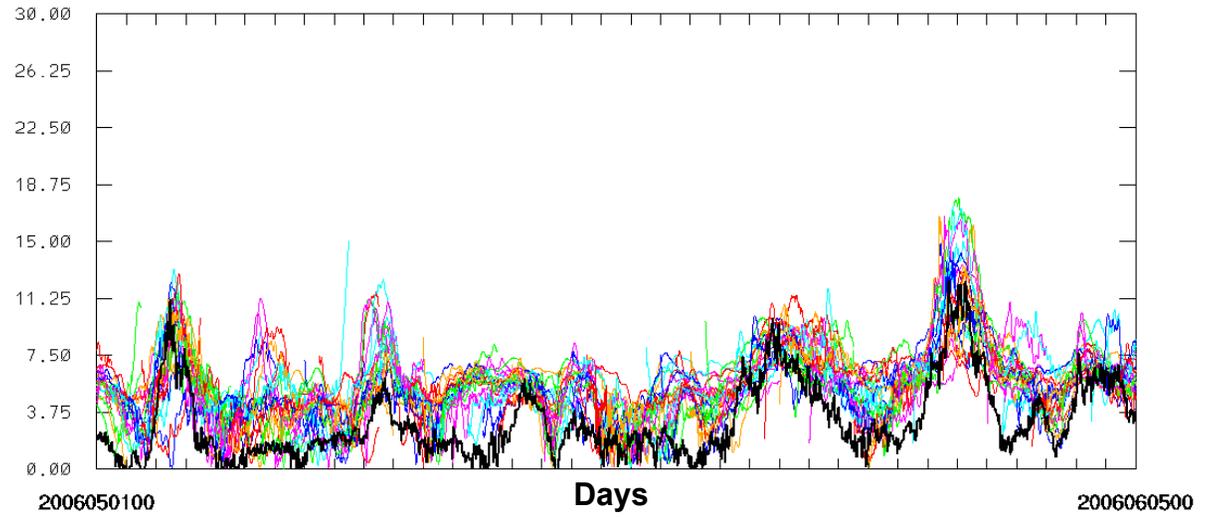

Black: MM5 Red: WRF
Solid: Bias Dash: RMSE

Forecast Length (hours)

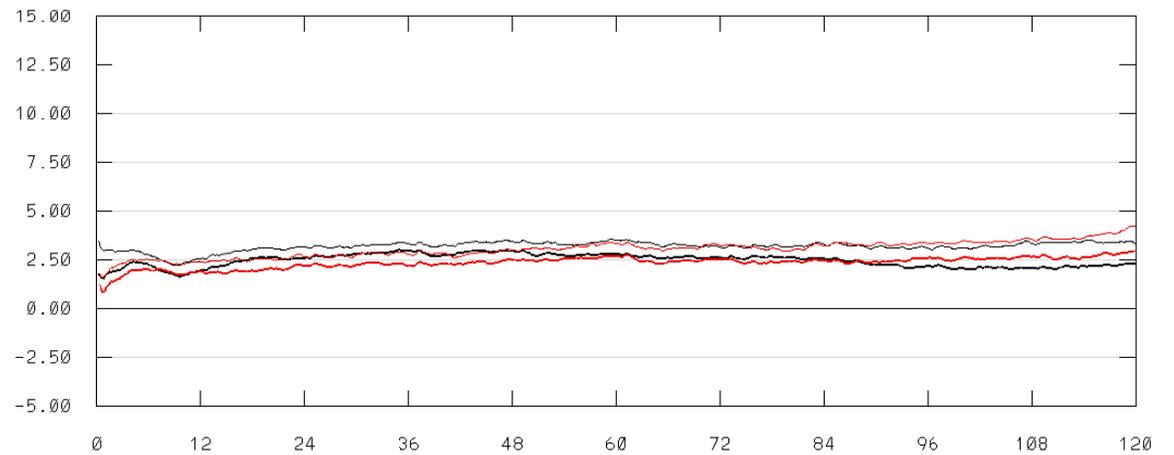

AWS Elev: 3250.0
MM5 Elev: 3260.7 (10.7)
WRF Elev: 3260.9 (10.9)

Dome C -- Wind Speed (m s⁻¹)

Tight cluster

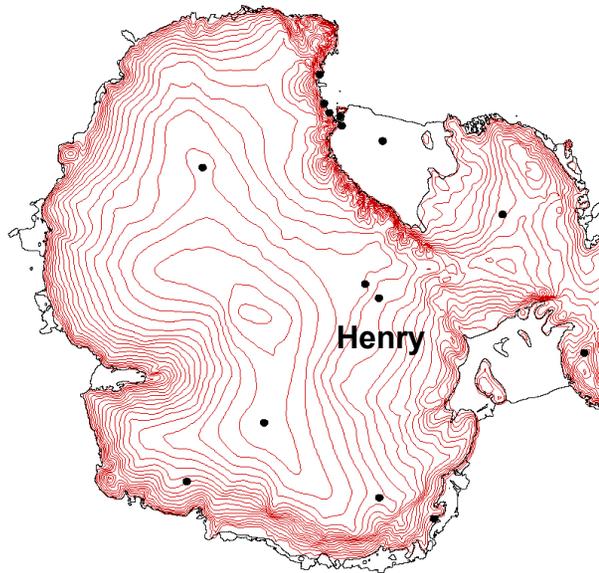

Low bias

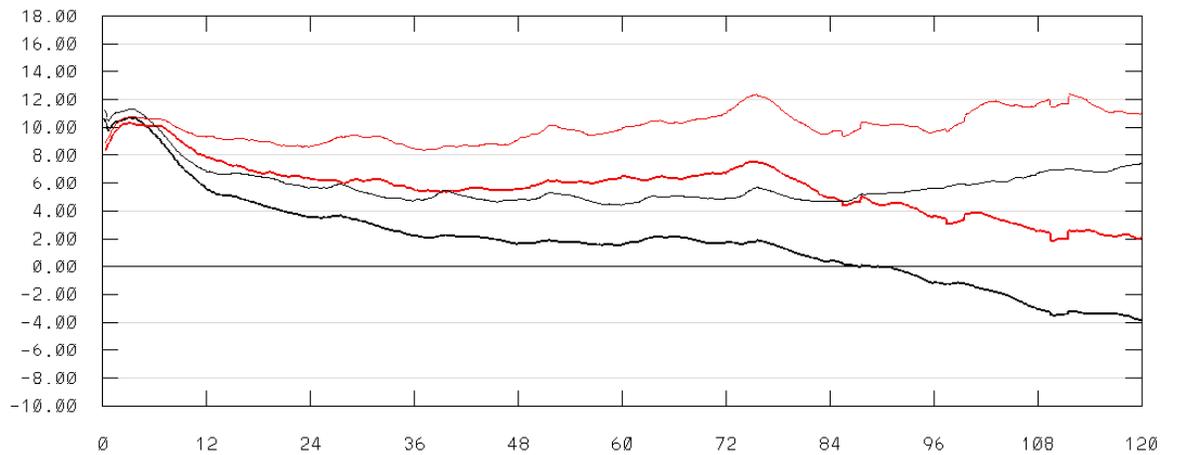

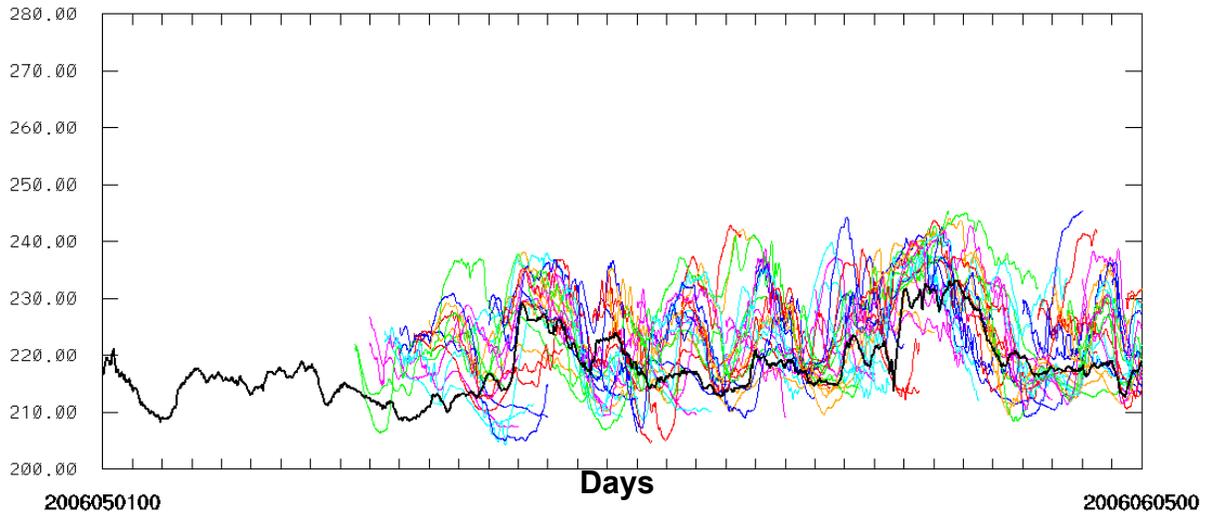

Black: MM5 Red: WRF
Solid: Bias Dash: RMSE

Forecast Length (hours)

AWS Elev: 3250.0
MM5 Elev: 3260.7 (10.7)
WRF Elev: 3260.9 (10.9)

Henry -- Temperature (K)

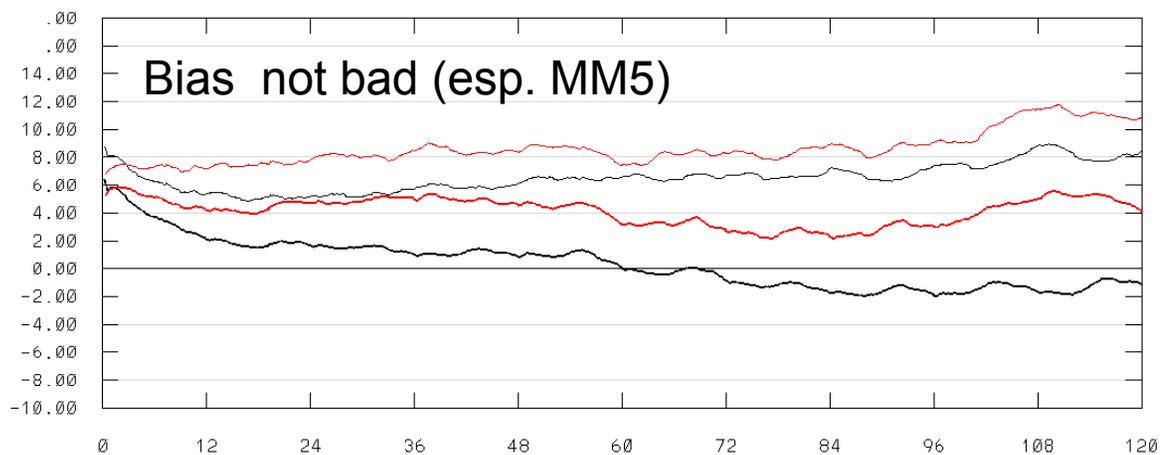

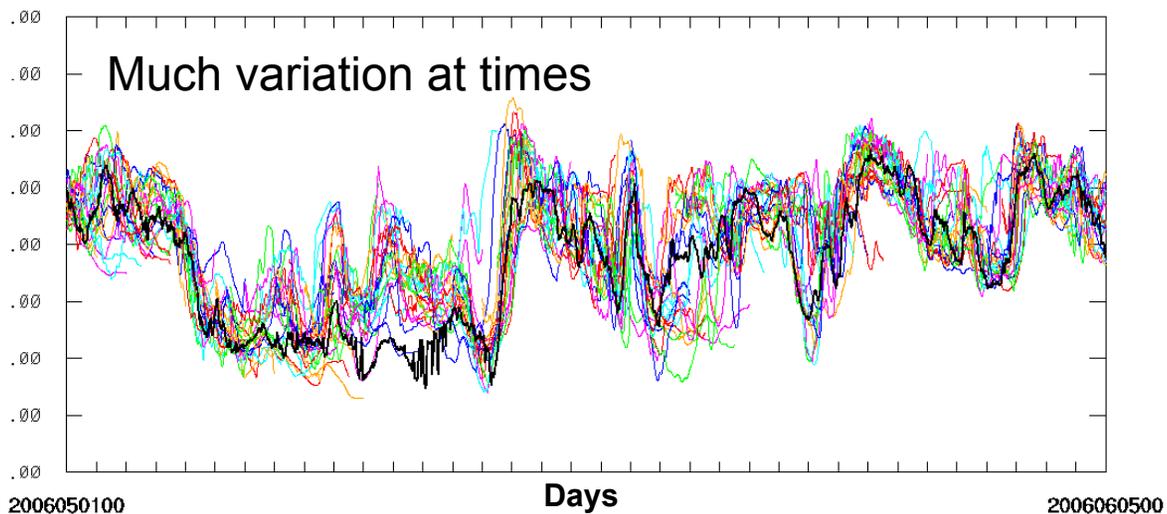

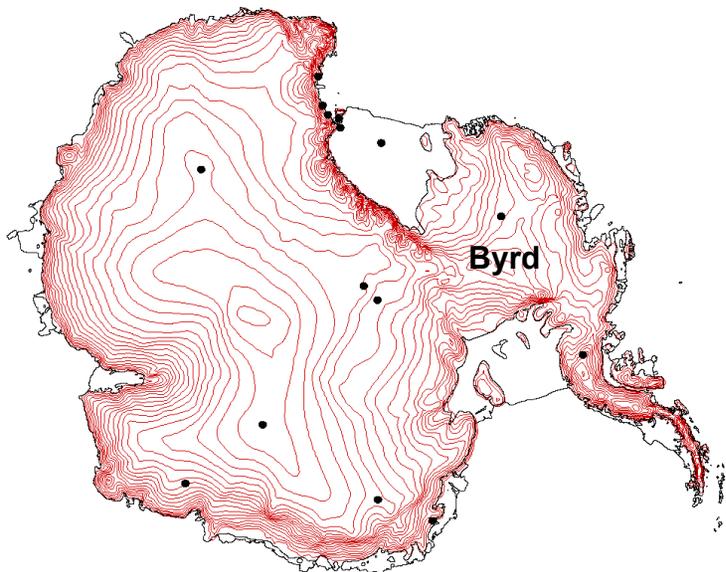

Black: MM5 Red: WRF
 Solid: Bias Dash: RMSE

Forecast Length (hours)

AWS Elev: 2755.0
 MM5 Elev: 2686.6 (-68.4)
 WRF Elev: 2686.3 (-68.7)

Byrd Station -- Temperature (K)

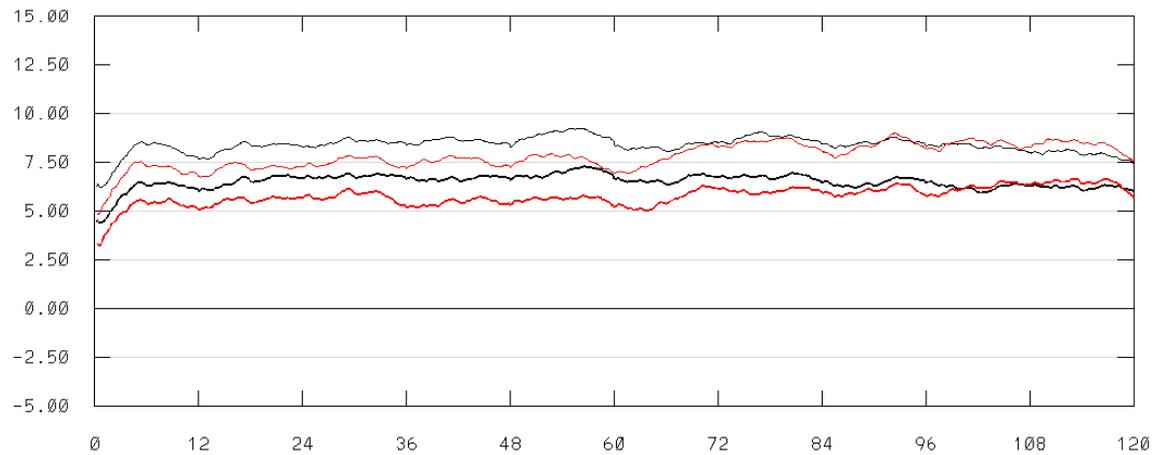

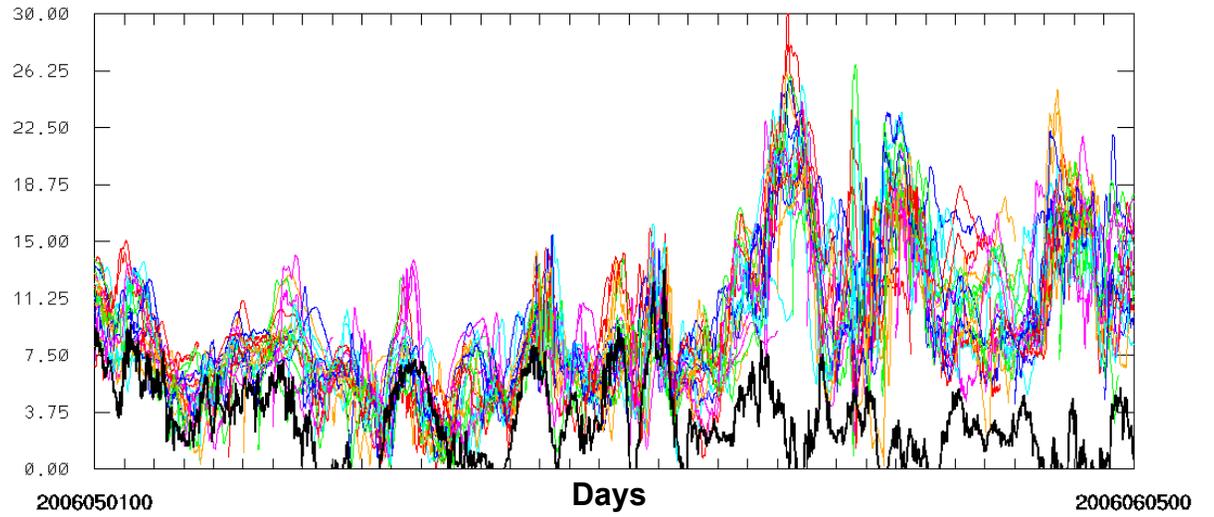

Black: MM5 Red: WRF
Solid: Bias Dash: RMSE

Forecast Length (hours)

AWS Elev: 1530.0
MM5 Elev: 1544.7 (14.7)
WRF Elev: 1544.7 (14.7)

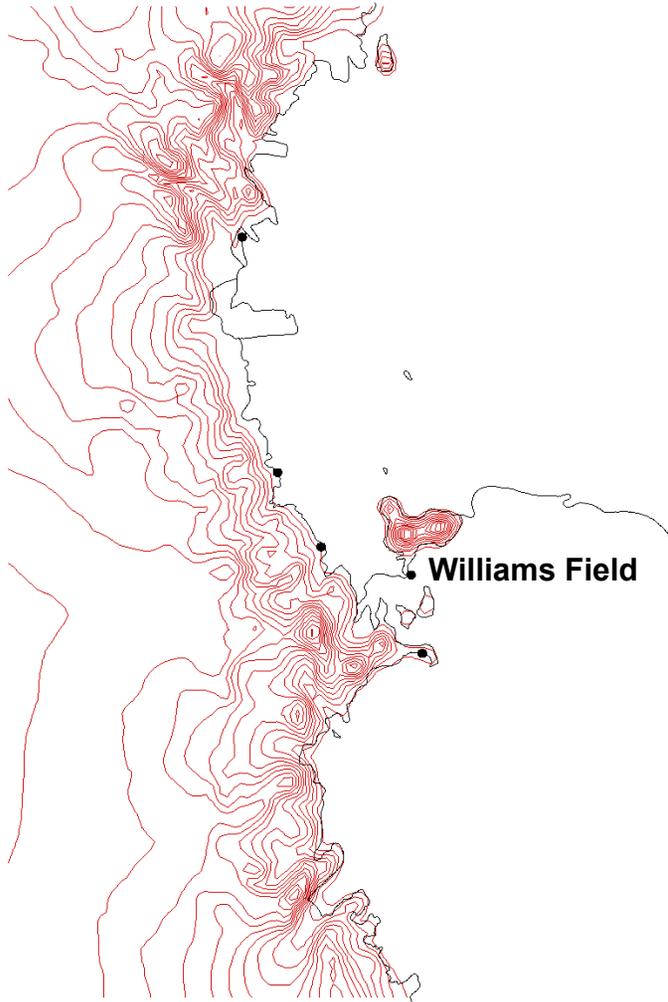

Byrd Station -- Wind Speed (m s⁻¹)

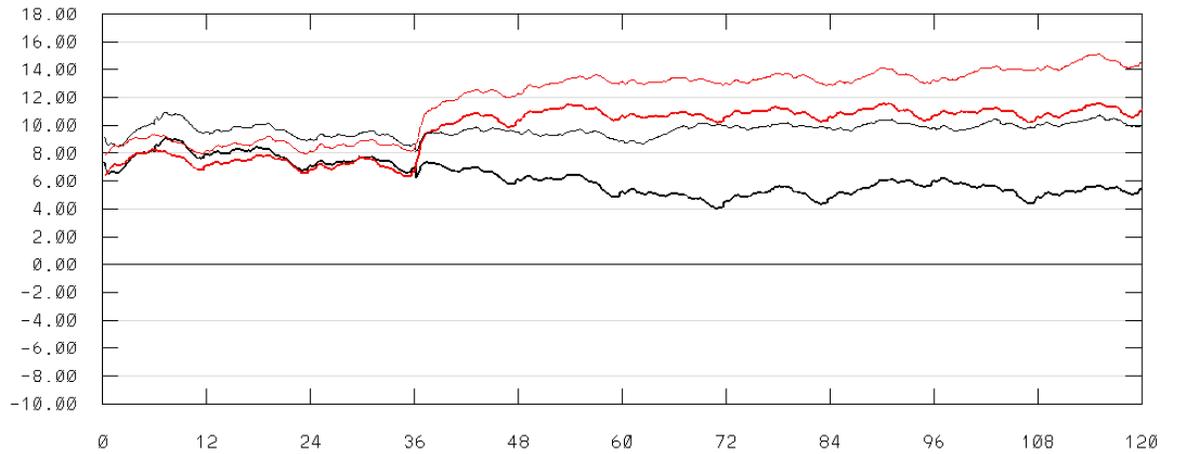

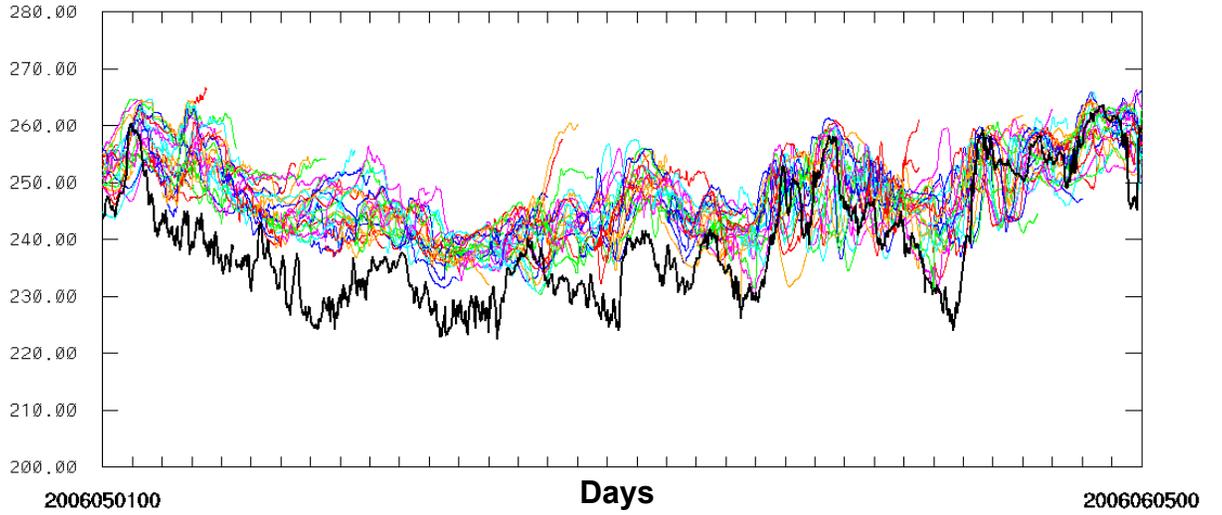

Black: MM5 Red: WRF
Solid: Bias Dash: RMSE

Forecast Length (hours)

AWS Elev: 1530.0
MM5 Elev: 1544.7 (14.7)
WRF Elev: 1544.7 (14.7)

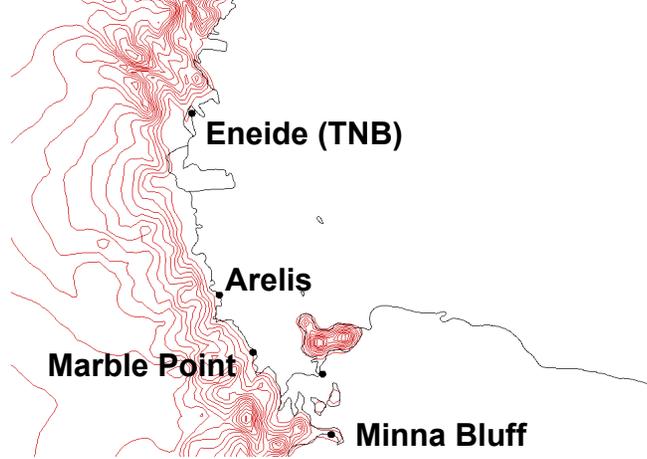

Williams Field -- Temperature (K)

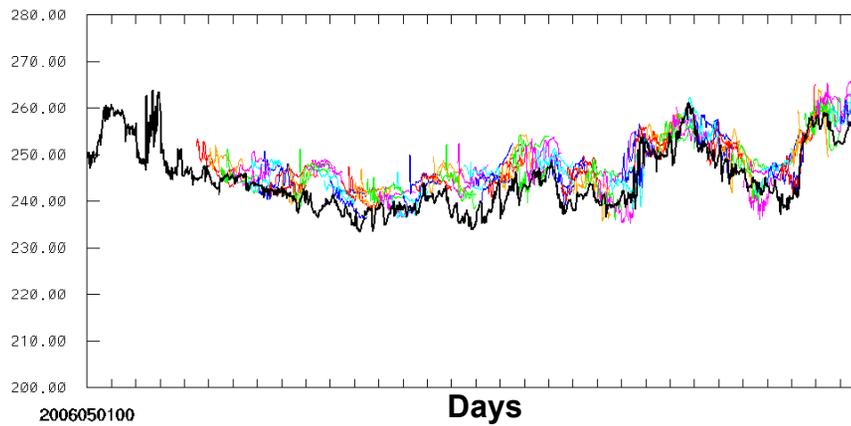

Black: MM5 Red: WRF
 Solid: Bias Dash: RMSE

Forecast Length (hours)

AWS Elev: 14.0
 MM5 Elev: 115.8 (101.8)
 WRF Elev: 83.2 (69.2)

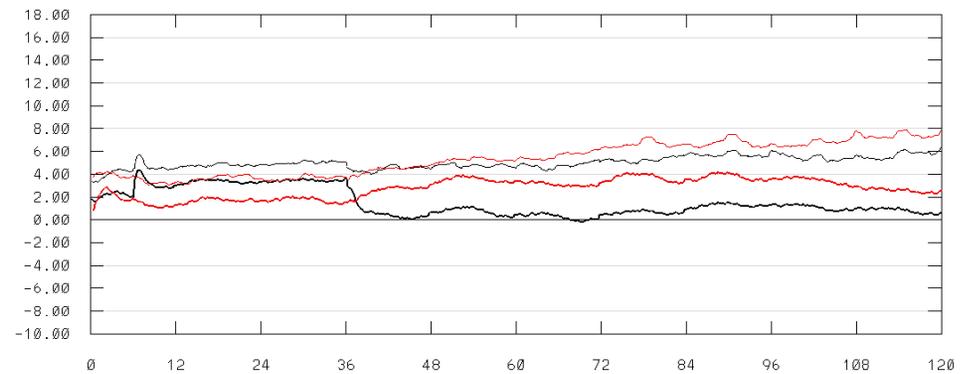

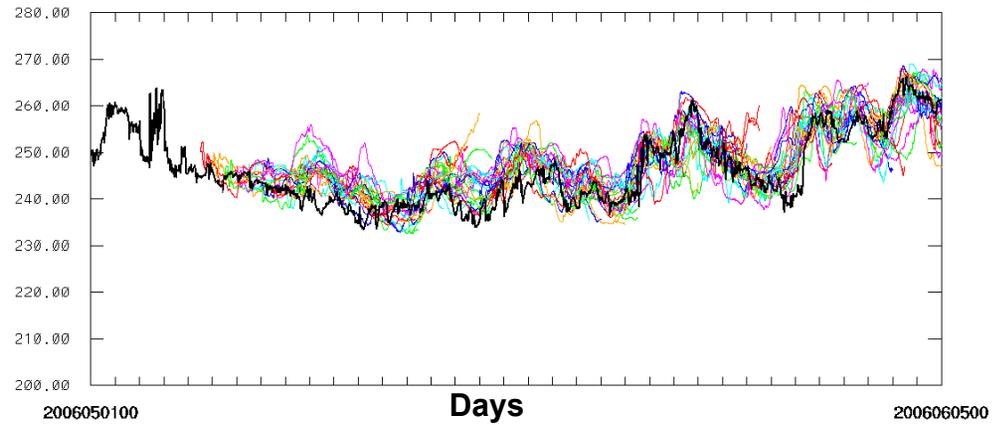

2.2-km Grid

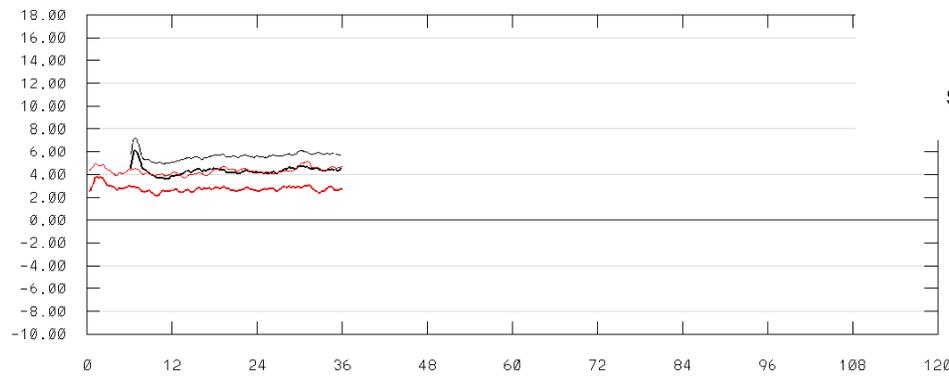

Marble Point -- Temperature (K)

20-km Grid

Black: MM5 Red: WRF
 Solid: Bias Dash: RMSE

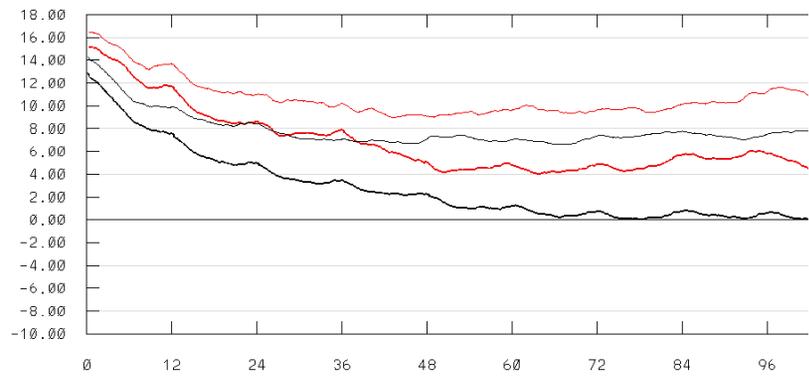

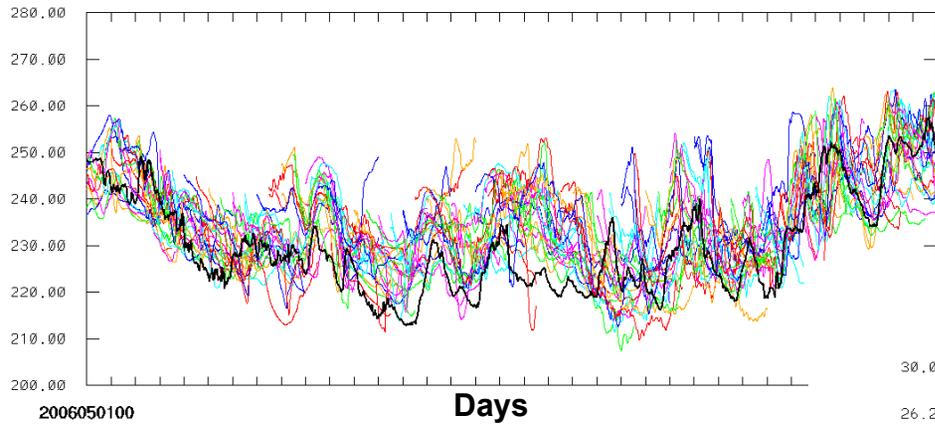

AWS Elev: 108.0
 MM5 Elev: 304.5 (196.5)
 WRF Elev: 313.7 (205.7)

Black: MM5 Red: WRF
 Solid: Bias Dash: RMSE

AWS Elev: 108.0
 MM5 Elev: 36.7 (-71.3)
 WRF Elev: 39.4 (-68.6)

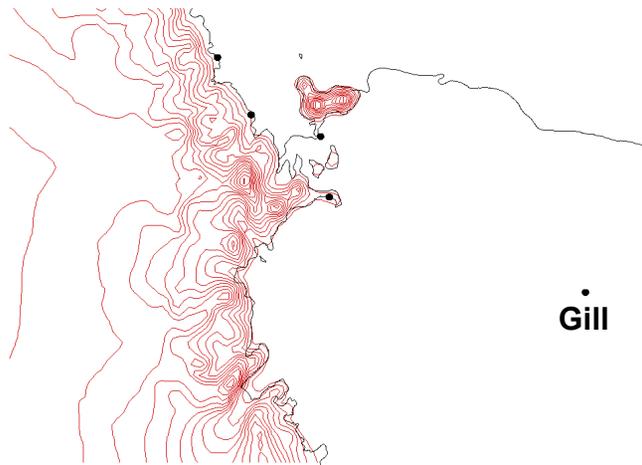

Gill -- Temperature (K)

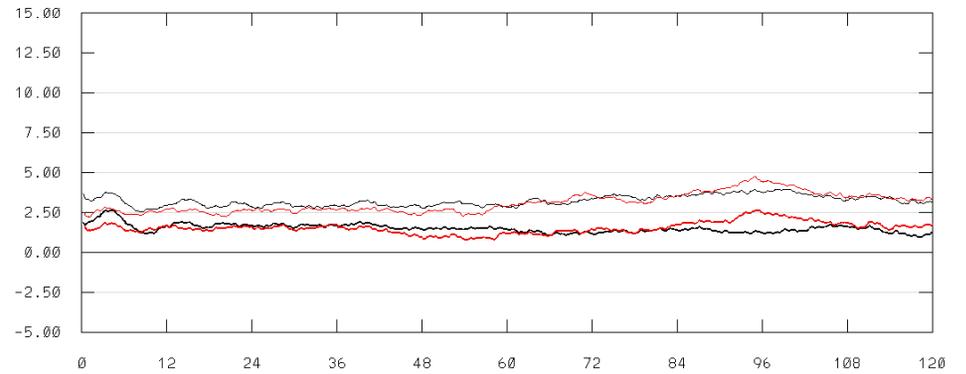

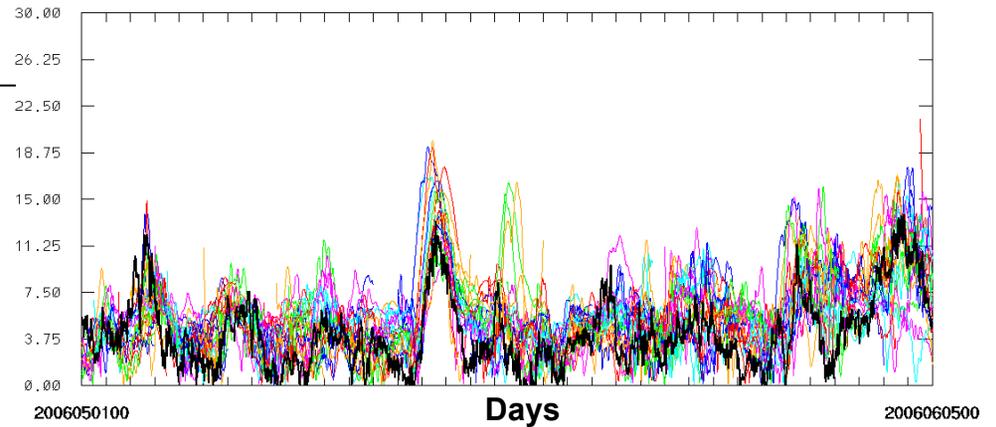

Black: MM5 Red: WRF
Solid: Bias Dash: RMSE

Forecast Length (hours)

AWS Elev:
MM5 Elev:
WRF Elev:

Gill -- Wind Speed

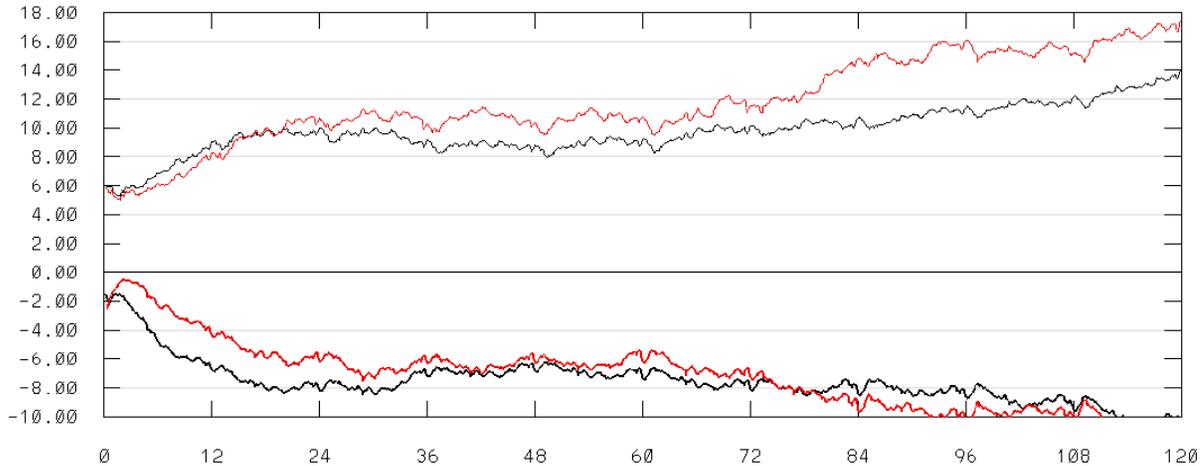

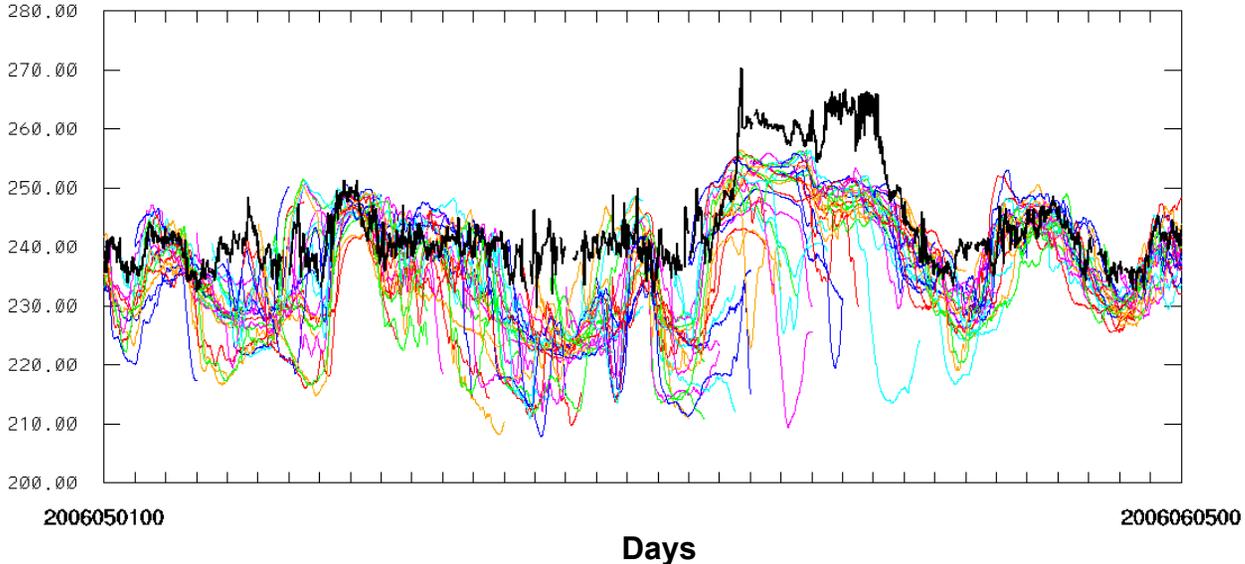

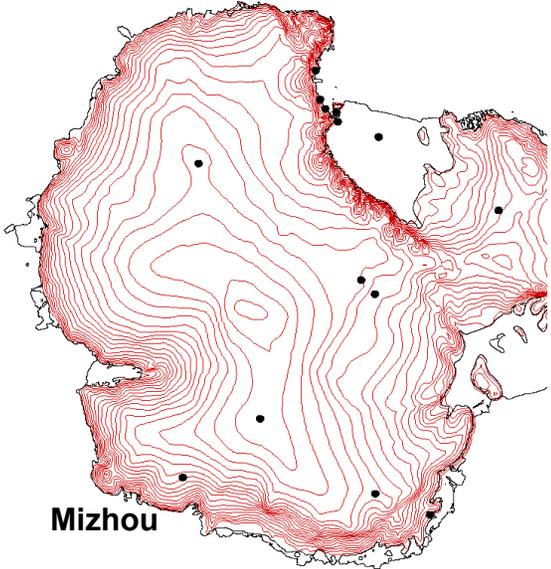

Black: MM5 Red: WRF
Solid: Bias Dash: RMSE

Forecast Length (hours)

AWS Elev: 54.0
MM5 Elev: 52.0 (-2.0)
WRF Elev: 52.0 (-2.0)

Mizhou -- Temperature (K)

Black: MM5 Red: WRF
 Solid: Bias Dash: RMSE

Forecast Length (hours)

AWS Elev: 2260.0
 MM5 Elev: 2231.4 (-28.6)
 WRF Elev: 2230.6 (-29.4)

Discussion

- Useful statistics for forecasters?
 - Statistical correction to model time-series output?
- Initialization
 - GFS – Too warm over plateau; too warm over Ross Ice Shelf
 - Ice temperature?
- Warm bias on the plateau
 - Strategies to investigate and address?
- Why such variability among forecasts?
- Default Noah LSM setup probably not optimal for Antarctica
 - “Soil” characteristics?
- Additional stations available in real time?
